The Autodesk Revit software team is excited to announce that the Revit API platform is now more

---

extensible than ever!

Extensibility is the process of adding new capabilities to software using technologies that allow developers to connect with the user interface (UI) or functionality of existing software. Autodesk Revit 2019 introduced dynamic parametric commands to deliver dynamic and interactive workflows for architects, engineers, and others. It also introduced the ability to create interactive assembly files

---

with dynamic views. In Autodesk Revit 2023, we are delivering new powerful commands that enable construction professionals to incorporate parametric design into their workflow while combining the power of parametric modeling with interactive presentation. Revit API Platform The Revit API Platform is the foundation of Revit modeling. It allows architects, designers, and

---

engineers to model, analyze, and document their designs using industry-standard, open protocols. This enables developers to build new applications on the Revit platform. The following sections describe the new capabilities available in Autodesk Revit 2023 that are enabled by the Revit API Platform. Content Customizer Revit 2019 introduced custom views of content elements, such as layers
