The older, 2 pronged style is being replaced with the new type, which is a cylindrical post, with 3 contacts: 2 through-holes for grounding and the third contact which is a circular for power. 1) I am wondering if anyone is using the 3 pronged plug outlet in a different way? 2) I am wondering if there are any safety issues with using the 3 pronged plug outlet other than the grounding through the prong itself? A: The old style has relatively low risk of shock. There's no physical reason to suspect that the third terminal could be dangerous. People still use the old-style plug for the same reason they still use the 3-prong receptacle for a light socket: it's convenient. The newer "circular" style is more trouble. If someone were to connect the circular plug to an appliance that worked by means of alternating current, and then to connect an appliance that worked by means of direct current, the risk of experiencing an electric shock is relatively high. The contacts on the plug are exposed and not insulated. The exposure permits the transmission of stray electric field lines, which can be increased by nearby electrical equipment, which in turn can be increased by moisture, dust, or bodily fluids on the contacts. The aluminum shell is exposed. Aluminum oxidizes with exposure
