Set up a new document When you first start Photoshop, it opens the new document you select. If you're closing the last document, make sure the new document is set to the appropriate size and resolution of your image. Figure 10-3 offers two predefined document presets to choose from when you first start Photoshop. In addition, you can change to any of the nine additional predefined document presets that are available. The Darkroom preset is standard for most photographers. This preset is optimized for shooting in black and white, the best conditions for shooting slides, transparencies, and negatives. ## Using Layers Layers are the organizing building blocks of a Photoshop document. You can use them to mix and match pixels, images, and effects to create and edit individual layers. A layer is, in effect, a transparent layer on top of the document that you can move, resize, add and delete pixels to, and otherwise manipulate as necessary. You can even edit and move the individual paths of an image's path. A `_path_` is an outline of the image. It's like a pencil sketch used to guide the eye in a painting. Make sure that you always keep at least one layer on top of another layer. If you don't, the next step in the process is to work on an image with no layers on it. You can always add and subtract layers later. It's easier to retouch a file with no layers than with an image with layers and then delete layers. If you're planning to retouch an image using layers and graphics, delete all the original layers before opening the image in Photoshop. Figure 10-3: As shown in the example on the left, you have the choice

Occupant restraint systems for automobiles are becoming more prevalent. For example, an airbag is deployed in many vehicles to restrain a vehicle occupant. An airbag is typically a circular bag that inflates towards the vehicle occupant. An airbag typically inflates with the pressurization of gas delivered by an inflator. The inflated airbag can restrain the vehicle occupant by applying pressure to the vehicle occupant's chest area. Airbag inflators can be controlled as part of an inflatable restraint system, such as an airbag system, that can be employed to restrain a vehicle occupant in the event of a vehicle collision. For example, vehicle airbag systems can be deployed when the rate of change of the deceleration of the vehicle is above a threshold. The airbag systems can also be controlled by vehicle occupants as a means of affecting occupant comfort. For example, the airbag systems can be disabled by an occupant to ensure that the occupant remains out of the airbag, e.g. for safety reasons. As airbag systems become more prevalent, there is an increasing demand on the vehicle design community for robust and intuitive airbag control systems. Systems and methods described herein satisfy these demands.

Q: How to fix Error 2: Unable to read the first line in Windows command line I'm trying to compile a C++ program on Windows 7. I tried to download the gnu toolchain first and activated it in Visual Studio 2012, but then I got this error: Error 2: Unable to read the first line in package listfile C:\Program Files (x86)\Microsoft Visual Studio 10.0\VC\vcvarsall.bat. I also tried to install the Visual C++ compiler to Visual Studio 2012 without activating the package first: C:\Program Files (x86)\Microsoft Visual Studio 10.0\VC\vcvarsall.bat and I got this error: Error 3: 'CMAKE_COMPILER_IS_GNUCXX' is not recognized as an internal or external command, operable program or batch file. I don't understand the error messages. A: For the GCC toolchain, I am guessing that you have actually already done this. As @Arun pointed out, the error message is misleading. It is telling you that the variable CMAKE_COMPILER_IS_GNUCXX is not recognized. Unfortunately it is not
