. Drive La Voz Del Noce Lyrics.scp.neas-on.net/ or ezvido.com Â . descri voce garmin dialetto napoletano 5 2018 Â . I need to find the last "voce garmin dialetto napoletano" in that XML file and grab its value. A: There are two problems I see with the piece of code you have. Firstly, the code needs to be inside a try-catch block so that you can catch any exceptions and display the proper error message to the user. Also, you need to ensure that the element actually exists. If it doesn't, then this will fail. In order to check if that particular element exists and grab the value, you need to check if it's present like this. `String text = doc.getElementsByTagName("voce garmin dialetto napoletano")[0].getTextContent().trim();` As you can see, the text content will grab the value if the element is present, otherwise it will return an empty string. In this link, you will find a bit more information about how to check if the element exists and grab the value. Note that the above code will also return the first text node in the document if you don't have any more "voce garmin dialetto napoletano". To get around this, you can also use the `getNextSibling()` method if you want to get the next sibling element instead. Here's a modified version of your code. Please let me know if that helped.

```
Document doc = Jsoup.connect( "").userAgent("Mozilla") .timeout(1000).get();
try { Element voceG = doc.getElementsByTagName("voce garmin dialetto napoletano")[0];
System.out.println("VOICE: " + doc.textContent().trim());
System.out.println("VOICE: " + voceG.textContent()); // get the next sibling node
System.out.println("THIRD: " + doc.get c6a93da74d
```
