The new feature in the context of Lightroom 5 is the ability to create a smart collection. You can create collections based on keywords, such as “friends,” “effortless portraits,” and “beach.” I’d love to see a street directory. Originally, people used folders to organize collections, but those are rather limited and most people tend to forget where they put stuff. With the new smart collections, you don’t have to worry about that. You just click on the keyword and the photos with that keyword are automatically added in the smart collection. If you just want to compare photos at a glance, there’s an Organizer widget now that shows with a click each filter applied to your files and also groups them by date or location. In the Compare section, there’s also a new option to automatically compare Smart Objects and Adjustments. However, in my testing so far, it seems to work better if I manually compare them. Of course, you can’t always tell if you’re doing the right thing, so keep that in mind. There’s also a greatly improved Margins panel in the Viewer. At any point, you can adjust the top, right, bottom, and left margins. Before, the panel had a fixed size that was uselessly small. Additionally, you can now use the cursor to rotate, move, and crop screen pictures. If you’ve been a faithful Photoshop user for some time, you know that the Creative Cloud features are increasingly becoming the standard. Lightroom 5 also adds some important improvements — integration with Flickr, as well as improved management of images (categorization, garbage-collection, etc.), and it’s definitely saved the lives of some of my customers. You’ll love CAM (Content-Aware Fill), too. Basically, it’s uses intelligent Photoshop brushes coming in from Britain (maybe the US as well) to fill in missing elements of pictures, such as people’s faces, when added to a photo. It can also apply a gradient, in effect, from the edge of the missing person's face, towards the center of the face.

The most popular graphic design software, Adobe Photoshop lets you create and modify various kinds of graphics and images. You can use it to create shapes, draw patterns, add and animate text, or make your own art. You can edit the canvas, add gestures, or even animate objects. To create a logo, you'll need to work in a vector-based graphics software like Illustrator. But it doesn't end there. You'll also need to be able to create and manage files, a web-hosting service, and have basic understanding of the internet. The first step in designing a logo would be to create a design concept. In the following example, I've started out with a simple design concept. I then created a Photoshop document using a template that matches that design. I'm sure that you'll find your own design process is different than this, so you might find it best to read my complete guide . Below is an example of a logo I created using Photoshop. I drew a simple 3D-looking object in Illustrator and imported it into Photoshop. I then created the logo in Photoshop and added it to the document. You can find guides and tutorials to design icon fonts on makeiconfonts.com . One of the most important things to consider when creating a logo is quality. Many people are so focused on their brand that when they create a logo, they completely disregard what their customers will see. Using a logo that is too pixelated, blurry, or based on low quality images will automatically give the brand a poor impression. It's important to think about how the end product will look and appear to your audience. If you plan on selling your logo with a business card or online, you'll need to ensure that it looks sharp, straight out of Photoshop. This guide from Photoshop will help launch your business card or print job with a professional look. e3d0a04c9c
